

Networks of Climate Watch: Interdependencies and biodiversity effects of municipal climate actions

Onerva Korhonen, Jouni Tuomisto, Petter Holme

COMPON workshop

22.3.2023

**Aalto University
School of Science**

**SUOMEN AKATEMIA
FINLANDS AKADEMI
ACADEMY OF FINLAND**

Why municipal climate actions?

- Crucial: understanding dependencies of actions, actors, and impacts
- **Why** & **how** municipalities do?
 - policy networks (= social & semantic networks)
- **What** municipalities do?
 - aggregation studies: overall contribution from region's climate pledges (Hsu et al. 2019, Kuramochi et al. 2020)
 - case studies: zoom-in to single actors through document analysis & interviews (Lamb et al. 2019)
- **Network approach** (Holme & Rocha 2023, Kim 2020) combines the best of both:
 - Large number of municipalities as in aggregation studies
 - Ability to zoom in as in case studies

Why *Climate Watch*?

- Web-based tool for monitoring progress of climate actions
 - developed in Helsinki, Finland 2020
 - currently ~30 users worldwide
 - free if self-maintained, Kausal Ltd. sells support + extra features
- Data:
 - semi-open: municipalities publish under CC-BY 4, database access through Kausal
 - climate actions + 3 levels of indicators for progress
 - causal paths from actions to indicators
 - metadata: descriptions, schedules, key words, responsible parties, ...

Why *Climate Watch*?

Insight network

actions

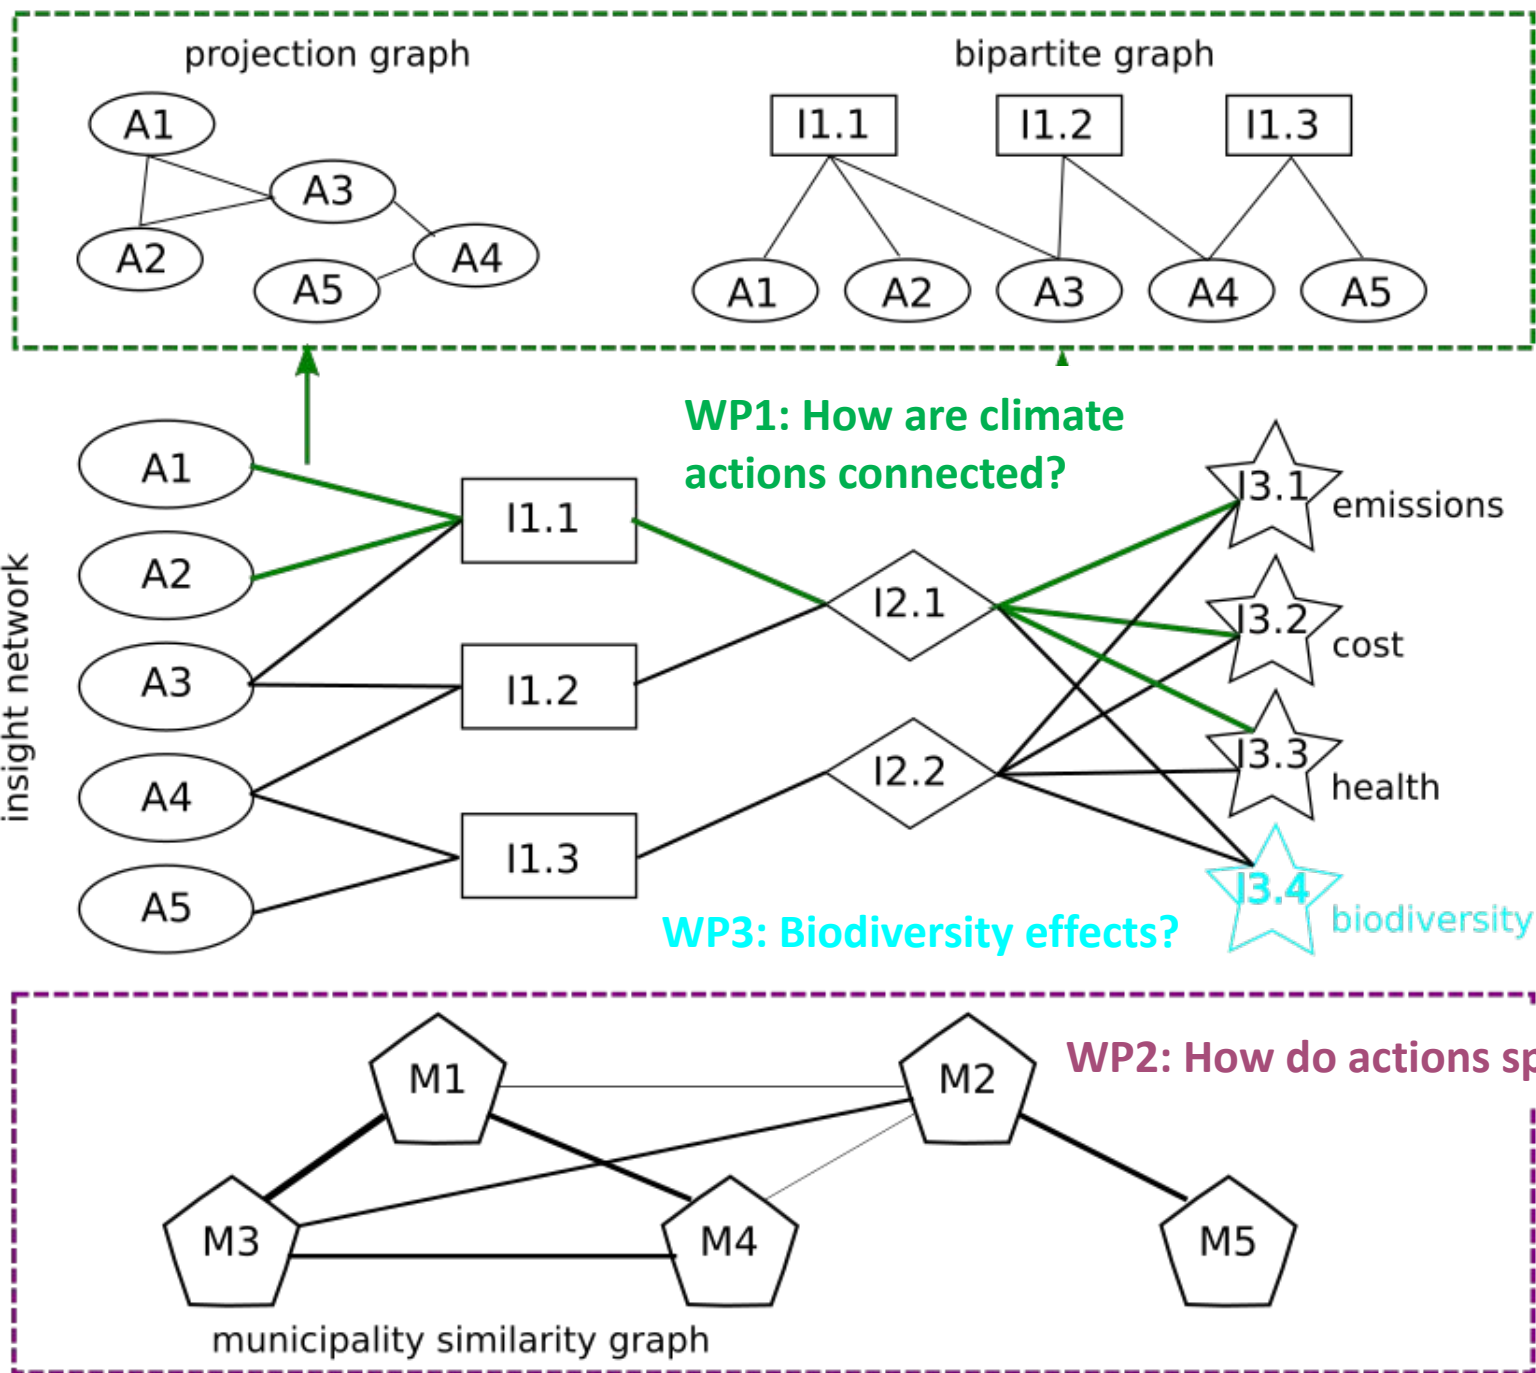

indicators
(3 levels)

within municipalities

insight network

between municipalities

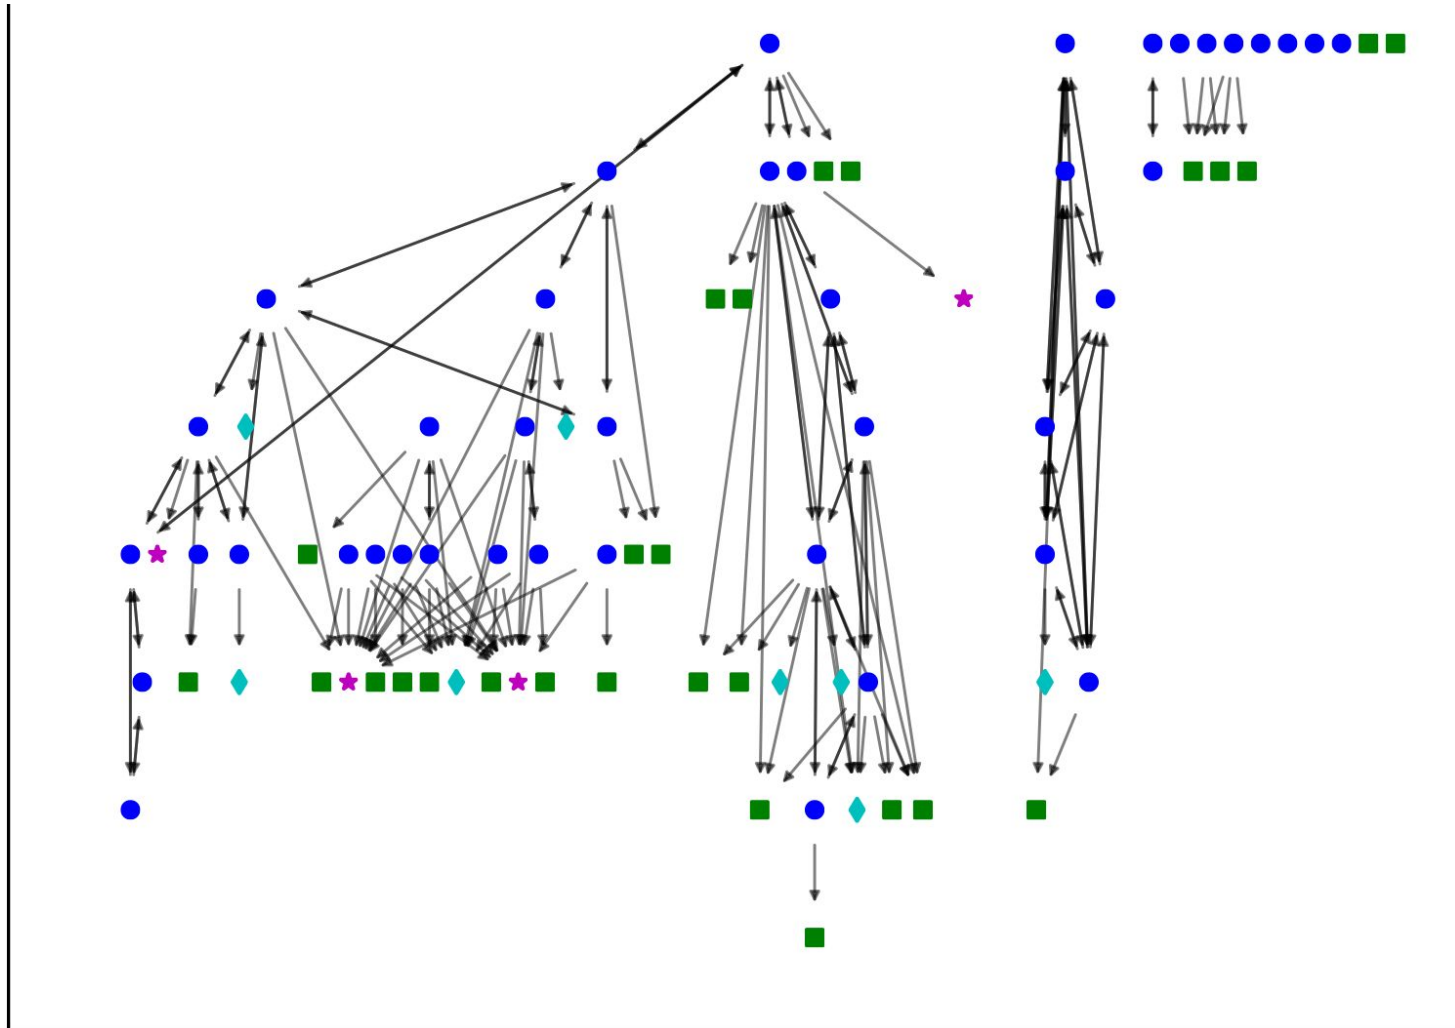

WP1: How are climate actions connected?

- Which actions **support and hinder** each other?
- What's the **optimal level of interconnectivity**?
- What's the **optimal set of actions**?
- To be answered through network analysis (ask about details!)

(Very) preliminary results

Great (insight network, Indigo Shire)...

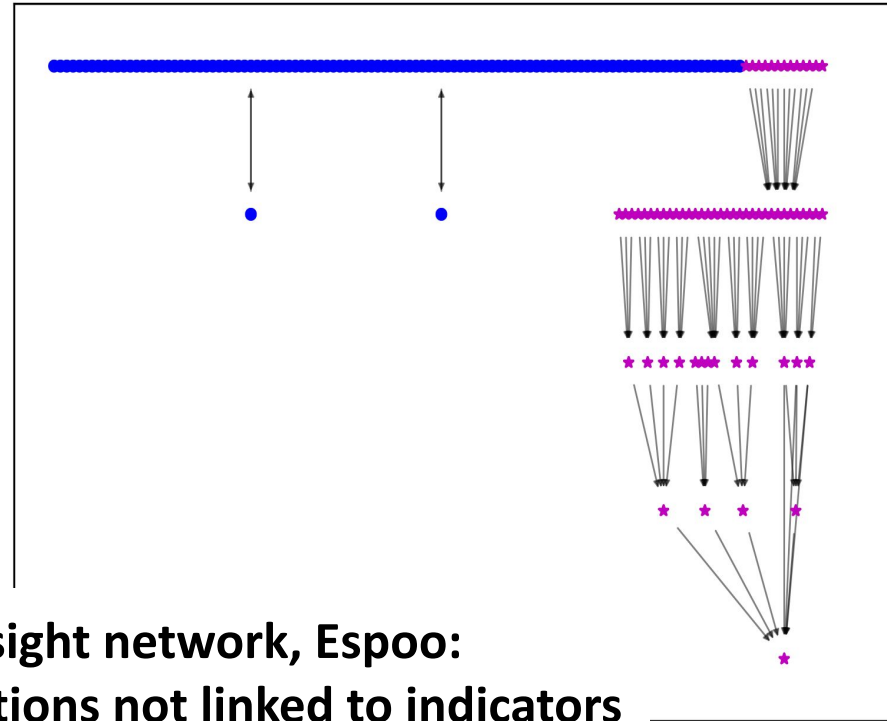

(Very) preliminary results

... but also...

Insight network, Leichlingen:
indicators not set

Insight network, Espoo:
actions not linked to indicators

Data issues to be fixed through
document analysis, interviews, ...?

(Very) preliminary results

- **Projection graph:** nodes = actions, link= contributing to same indicator
- **Density** = fraction of all possible links present

Projection graphs are sparse...

... also after excluding linkless nodes

- **Similarity of municipalities:** average similarity of action descriptions
- **Quantifying learning:** do municipalities with similar pasts have similar futures?

- **Biodiversity effects** to be added as a new top-level indicator (based on document analysis, interviews, ...)
- Optimal interconnectivity and actions for climate-biodiversity nexus through network analysis

Conclusions

- Understanding dependencies between actions is crucial for efficient climate action
- Network analysis: zooming in to multiple municipalities at once
- Climate Watch data: semi-open & diverse, currently from ~30 municipalities
- Issues with missing data: fixing possible but requires manual work, document analysis, interviews, ...
- Municipalities either don't list the dependencies between actions or don't know them
